

Threat Assessments

We understand that you need to make difficult decisions about what assets to protect, and what resources to expend protecting them. The goal of Threat Modelling is to provide you with evidenced-based information that you can use to make an informed decision.

Our consultants will look at your organisation from the viewpoint of a hypothetical attacker, and use that viewpoint to create a report that details your areas of risk.

How we can help you

Identifying threats

Our CESG Certified consultants will identify the type of threat that your organisation is facing, where those threats are originating, and how those threats manifest themselves. At the end of the assessment, you will receive a report detailing your current threat model, complete with actionable points. This report will provide you with the information you need to make informed decisions on your organisation's cyber security.

Open source intelligence

For attackers to be successful, they need reliable information about your organisation. This could be information about your security, your staff, or your day-to-day operations. Our consultants use open-source intelligence techniques to collate publicly-available information, from the viewpoint of a potential attacker, and then deliver it to you in an actionable report.

Why choose us?

We have a detailed working knowledge of critical national infrastructure and general business threats. Our team has conducted threat assessments, and capability audits, for aerospace, shipping, and defence (including on the ground in Afghanistan).

They hold industry qualifications such as CESG Certified Professional (Information Assurance Audit), Certified Information Systems Auditor, BSI Lead Auditor, and Certified Information Systems Security Professional.
